# Connecting to Windows with a USB Cable

The first time you plug the Wallaby running Version 11 or later into your Windows machine, one of two things will happen. You'll either see a new RNDIS network device, or you won't. Let's deal with the non-functional cases first.
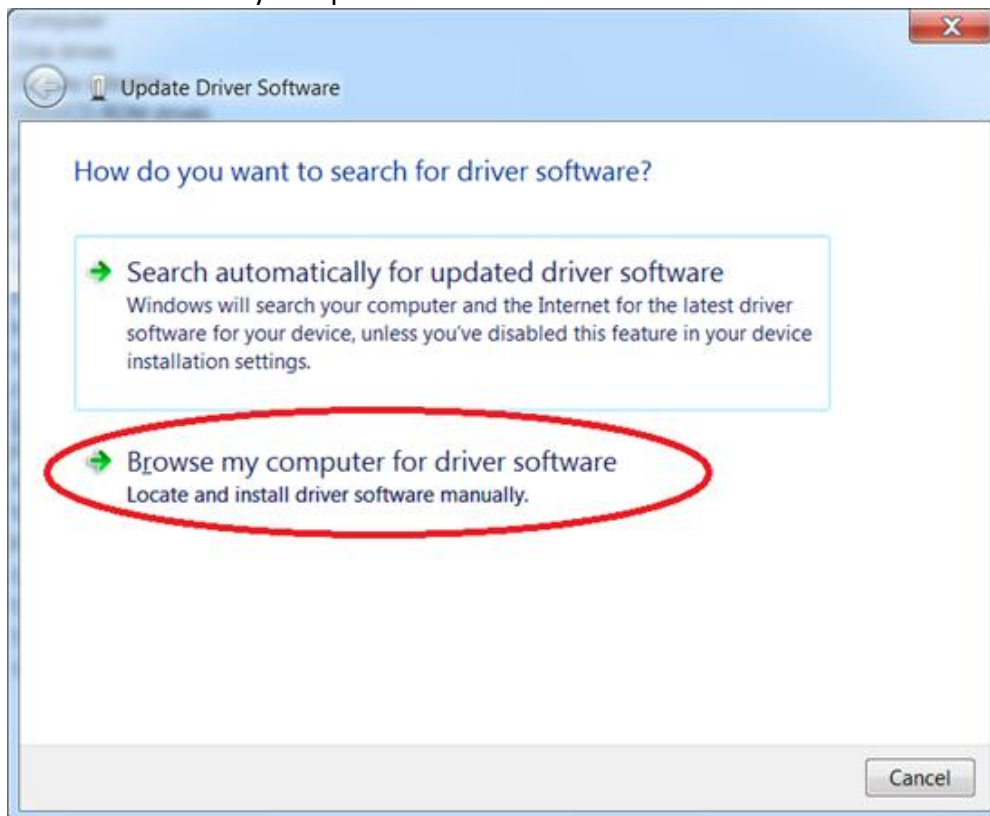

Open up the Device Manager by clicking on the windows icon in the bottom left and searching for device manager (you will need admin privileges). Locate the RNDIS network device - if it's not working it will look like this. If the RNDIS device shows up in the "Network Adapters" section, then you do not need these instructions.
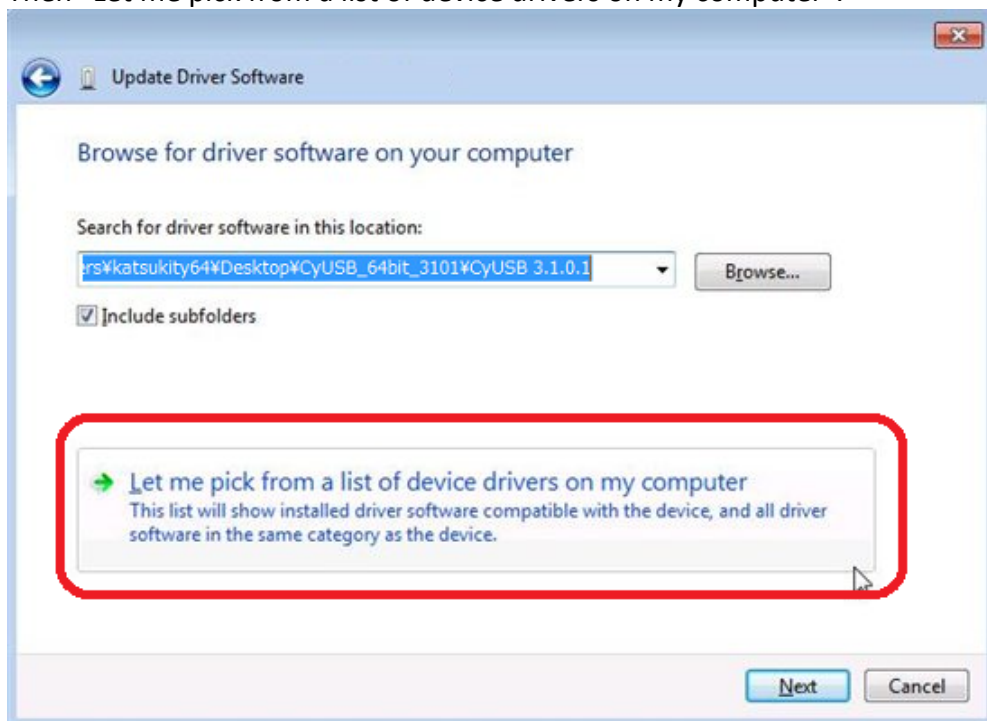

Right click on the "RNDIS/Ethernet Gadget" and choose "Update Driver Software..."
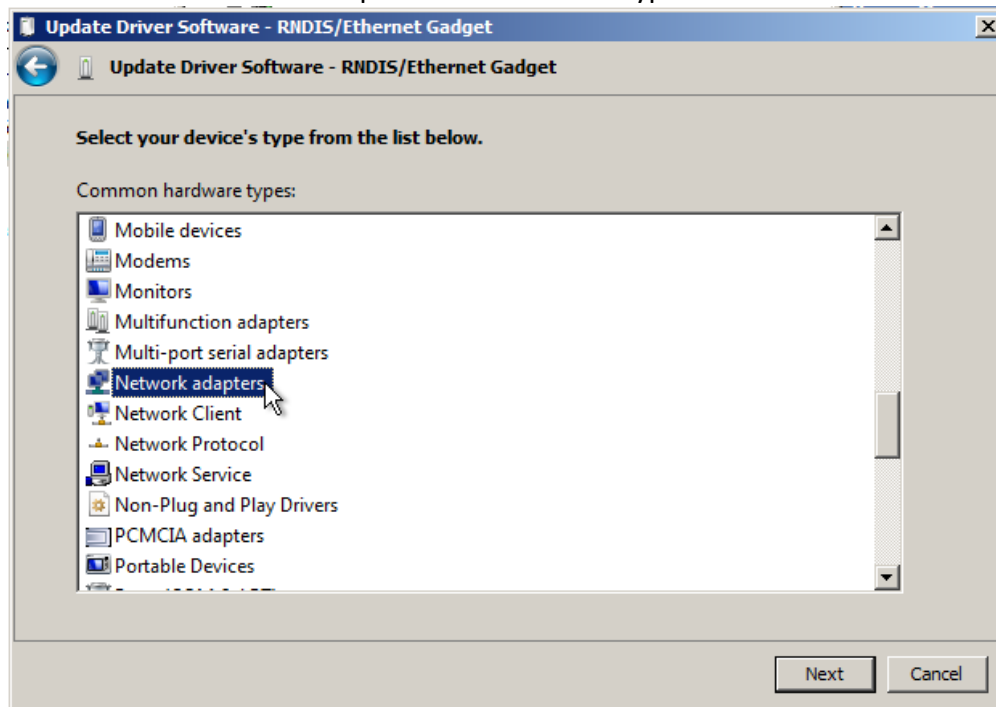

Choose "Browse my computer for driver software"

Then "Let me pick from a list of device drivers on my computer".

Then choose "Network adapters" as the device type and click "Next".

After a few moments, a drop down list of manufacturers and network adapters will appear, and you want to select "Microsoft Corporation" and "Remote NDIS Compatible Device" as shown here:

Click "Next" and then click through the "Update Driver Warning Dialog". Now the device should be showing in the "Network adapters" list, like this:

Now you can test the driver by going to **192.168.124.1:8888** in a web browser, like Chrome. Note that the Wired and Wireless IP address are different.
